# Stacka Sacks

**Interlocked stacking design that allows better strength and stability when stacked. Absorbeez unique patented design.**

Introducing a unique product, exclusively developed by Absorbeez in the UK to provide a strong, stable, effective barrier against flood water. **Stacka Sacks** - only Absorbeez could come up with a brilliant concept like this - and then produce it!

Designed for stability when stacked as a barrier wall so water can be held back or channeled away more effectively in flood situations. They are designed to be used in pairs which can be built up as a wall or barrier brick style or one on top of another to help prevent flooding at doorways. Both bags are stitched into three separate panels with an overall bag size of 1000 x 300 mm. The panels are filled to absorb different quantities, giving a corrugated

effect when activated, which allows each sack to fit more securely onto the next giving maximum stability with no slip. The sacks are coloured black or white to allow for fast and easy stacking.

Far superior to standard sandbags or standard absorbent bags they are more stable and effective as a line of defence. The bags should be interlinked brick style for optimum performance.

**Stacka Sacks** are sold in pairs with discounts available on larger orders. Between them, the 2 stacked bags will absorb around 21 litres of unsalinated water. (approx 11/10 litres respectively)

The product is superior in stability and performance than any other bag whilst fewer bags are required for the job.

## Flooding is a major issue - Absorbeez is vital in the fight against floods

Absorbeez combine advanced technology with practical experience to produce a range of water absorbent products that are the best in class. **No other absorbent product can match our performance or range of sizes.**

They are easily stored, have a long shelf life and are easy to transport. They are extremely strong yet take up very little space when packed flat. They can be easily disposed of after use and are environmentally safe too\*.

### Specifications

The main material in the bags is a patented supacore multi layer cellulose fluff pulp containing a measured amount of sodium polyacrylate polymer granule heat and pressure bonded to form the supacore. All materials in the supacore comply with FDA/CFR177 and FDA21USC301. The outer bags are made of a textured polyester fabric composition with polypropylene double stitching for hard wearing and strength.

The materials used are not considered to be a hazard under normal use.

Absorbeez are fully approved by the leading insurance companies for the effective clear up and treatment of flood damaged premises, both commercial and industrial. The superb efficiency and speed combined with their versatility has made Absorbeez the first choice when dealing with insured losses and damage.
